RE: Docket ID FSA-2020-0004

On behalf of the apple growers of the United States, we are submitting this comment for consideration by the Department of Agriculture for the Notice of Funds Availability within the Coronavirus Food Assistance Program (CFAP).

## BACKGROUND

The top 10 largest apple producing states are, in order, Washington, New York, Michigan, Pennsylvania, California, Oregon, Virginia, North Carolina, West Virginia and Idaho. Each year, the U.S. produces about 250 million, 42-pound bushels of apples. Although the value of the 2019 crop is the lowest in a decade, in normal years it would exceed $\$ 4$ billion at the farmgate, and approximately $\$ 15$ billion in total economic activity when including downstream storage, sorting, packing, shipping, marketing, exporting and processing. There are approximately 5,000 commercial apple growers in 42 states across the U.S.

## SUMMARY

- In its CFAP analysis of price impact on growers, USDA used its own Agricultural Marketing Service (AMS) terminal data that are far removed from the prices received by growers, are often merely offerings and not actual sales, and can represent quantities as small as one bushel.
- Therefore, the Department's analysis is fatally flawed, and its determination that apple prices during the January 15-April 15, 2020 study period had not declined by 5 percent or more is incorrect.
- In contrast, we are submitting actual sales price data on 43.8 million bushels that show prices declined from 6.5 percent to 24.9 percent.
- Our data capture more than half of all the national sales from the study period.
- Approximately 95 percent of U.S. apple sales are made between packer/shippers and large supermarket chains. Data from these sales are not captured by AMS and therefore were not included in the CFAP analysis.
- Shipping volumes in the study period declined 24 percent.
- Stocks on hand are 15 percent larger than the previous record, and 26 percent above the fiveyear average.
- Apples in storage are still owned by the grower, are not under purchase contract, and grower payments are determined via pooling method (average pricing for all growers' fruit sold over a period of time). Therefore, growers are subject to market risk.
- With less than two months until the new crop harvest, a record-setting 19 percent of the 2019 crop remains to be marketed.
- Unlike more perishable specialty crops that experienced short-term inability to harvest and product destruction, the slow-down in apple shipments represents an accumulating effect on the market because this is a stored product.
- Exports normally comprise one-third of total U.S. apple sales. However, June 3, 2020 USDA data show that April exports declined 29 percent from March to the lowest April export level in a decade. January through April exports are 33 percent below the same period of two years ago.
- The value of the 2019 crop is the lowest in a decade

## This document addresses:

1. Price data
2. The lag in domestic shipping volumes
3. The lag in exports
4. The record-setting levels of existing stocks
5. Value of the 2019 apple crop
6. COVID-19 costs yet to be determined

## CFAP eligibility criteria

USDA announced that producers of specialty crops are eligible for CFAP payments in the following three categories:

## A. Had crops that suffered a 5 percent-or-greater price decline between mid-January and mid-April as a result of the COVID-19 pandemic;

B. Had produce ship but subsequently spoil due to loss of marketing channel; and
C. Had shipments that did not leave the farm or mature crops that remained unharvested.

We will address each criterion in turn.

Had crops that suffered a 5 percent-or-greater price decline between mid-January and mid-April as a result of the COVID-19 pandemic:

USDA's CFAP website states: "Payments for crops that had a 5 percent-or-greater price decline in sales price between January 15, 2020, and April 15, 2020. Producers must maintain records, such as a bill of sale, documenting the price received for the crop."

Comment: With respect to maintaining records "such as a bill of sale, documenting the price received for the crop," no documentation will exist for sales that never occurred. As we will address in greater detail below, growers are currently holding inventory that is 15 percent greater than the previous record for the month of June, 24 percent more than last year at this time and 26 percent greater than the fiveyear average. The value of those apples has declined dramatically and will continue to do so until they are ultimately sold or destroyed to make room for the new crop harvest beginning in two months.

## 1. PRICES HAVE DECLINED BY MORE THAN 5 PERCENT

USDA's description for determining the eligibility of growers for direct payments is whether the prices received by growers had declined 5 percent or more during the study period. Yet, officials have acknowledged the Department's analysis did not consider data of prices received by growers. How then could the Department have concluded with any statistical rigor that the prices received by growers had not declined 5 percent?

The incredibly low prices in the January starting point for the study period means that it would be even
more difficult to prove a grower price decline of 5 percent or more. That is, when the starting point is at or below the cost of production, and the cost of packing and shipping the apples exceeds the value of the apples, fundamental economic theory would lead us to anticipate a rise in demand. That basic economic theory did not hold true for apple sales during the January through April timeframe.

As we will demonstrate, the fact is that there was very low shipping volume during the study period. The demand for apples during this timeframe was, and continues to be, strongly inelastic and lower prices do not result in increased sales. COVID impacts in the global marketplace in which U.S. apples compete have fundamentally harmed U.S. growers.

Simply put, there will be no sales data for sales that never occurred. Nonetheless, a huge quantity of apples remains in storage and overhangs the market. Those stocks will likely remain there until the storage space is needed for the new crop harvest beginning in less than two months. This raises the prospect that apples will be destroyed this summer.

The CARES Act makes clear that direct payments are intended for growers, not downstream participants in the marketing chain such as distributors or terminal market operators.

The Department acknowledges it used AMS Market News terminal price data. Those data are collected at 12 terminal markets around the country, including Atlanta, Miami, Dallas, Los Angeles, etc. Those prices would include shipping from the farm, cold storage, washing, sorting, packing, more cold storage, and shipping from, for example, Yakima, Wash. to Atlanta, Ga. ( 2,518 miles).

The terminal prices would also reflect the unique motivations and market position of every seller. These are not grower prices. As was explained to us by AMS officials on June 3, the AMS terminal prices are offerings by sellers, not actual sales. When a sale does occur, the reported lots are typically as small as one box of apples sold to a convenience store or to a restaurant buyer.

Further, the AMS data show that no quantities per variety and price are listed. It is impossible to calculate a weighted average price without knowing the quantity of apples sold at each price.
The AMS Market News report includes price data on some varieties for which the national production is so low that data cannot be gathered specifically for it, and it is reported in the "All other" category. Some of those minor varieties have high prices. Simply adding these prices with all others without stating the quantity will distort the report.

This is the most fundamental component of any statistical analysis. That is, to use extreme examples to make the point, if one bushel of apples is sold at $\$ 30.00$, and 999 bushels of apples are sold at $\$ 20.00$ each, the average price of those 1,000 bushels is not $\$ 25.00$ per bushel.

Prominent apple shippers across the country have confirmed that terminal market purchases make up merely 1 percent to 10 percent of the total U.S. apple market, depending on geography and time of year. Further, 90 percent to 99 percent of U.S. apple sales are sold and shipped by multiple tractortrailer loads (1,029 boxes each) to supermarket chains such as Kroger, Walmart, Costco, etc. These sales were not included in the Department's analysis.

By using AMS terminal market data, the Department's subsequent analysis was fundamentally flawed and lacked substantial foundation, thus the decision to exclude apples from being eligible for relief through CFAP Category 1 had fatal shortcomings.

Once a price impact of 5 percent or greater is determined, it would be a simple matter for growers to document the quantity of apples in their possession and at-risk in the market on January 15 and compensate them on that basis. The CFAP process for grain and oilseed producers states, "Producers will be paid based on inventory subject to price risk held as of January 15,2020 ." This is exactly the process we recommended to the Department on April 24 (Appendix 1), more than three weeks before the CFAP announcement. We fail to understand why that same treatment inn't accorded to specialty crop producers, too.

The following price data sets come from actual sales of 43.8 million, 42 -pound bushels of apples. This quantity is more than half of all the apples marketed during the study period. These data came from surveys of marketers from the four largest apple producing states - Washington, New York, Michigan and Pennsylvania. Those four states' combined production is approximately 94 percent of the U.S. total.

The first data set comes from weekly reports compiled by the Washington State Tree Fruit Association and reflects approximately 85 percent of Washington apple sales. Washington state apple production comprises about two-thirds of the U.S. total, but an even higher share of total U.S. sales during the study period.

## Data from NASS

The Department could have used price data from its own National Agricultural Statistics Service (NASS). Historically, NASS price data were based on farmgate surveys. Unfortunately, for reasons that are unclear and were not announced, in February NASS began reporting these data on an FOB basis. This rendered any comparison or trend meaningless.

## Additional Data from NASS

According to USDA's May 2020 Noncitrus Fruits and Nuts Report, prices received by apple growers have been falling, having declined 20 percent in two years, and 16 percent in one year.

|  | $\mathbf{2 0 1 7}$ | $\mathbf{2 0 1 8}$ | $\mathbf{2 0 1 9}$ | $\mathbf{2 0 1 7}$ | $\mathbf{2 0 1 8}$ | $\mathbf{2 0 1 9}$ |

Noncitrus Fruits and Nuts 2019 Summary (May 2020)
USDA, National Agricultural Statistics Service

## 2. THE LAG IN DOMESTIC SHIPPING VOLUMES

In the roughly 14 weeks of the study period, with the exception of three weeks when domestic consumers were stocking up their pantries for the COVID-19 quarantine, shipments have fallen dramatically. Weekly shipments at the end of the study period were 24 percent lower than at the beginning of the study period. As a result, with less than two months before the 2020 crop harvest, the marketing of the 2019 crop is far behind historical levels. It is virtually impossible to catch up. All inventory is now being sold at a discount that reflects the decline that occurred during the "covered" timeframe.

Thus, 2019 crop apples will remain in inventory to continue depressing prices headed into harvest. All signs are for another excellent crop, and growers will be faced with the prospect of destroying 2019 crop apples to make way for the 2020 crop.

## 3. EXPORTS

Exports normally account for one-third of the U.S. apple crop, equal to approximately $\$ 1$ billion toward a positive balance of trade. A sharp drop in exports has exerted additional downward pressure on prices during the January to April period.

USDA Global Agricultural Trade System (GATS) data from June 3 show April 2020 apple exports fell 29 percent from March to the lowest April export level in a decade. The April exports were roughly the same as the retaliatory tariff-depressed exports of 2019 (an unfair trade situation that continues to this day).

Exports for the combined months of January through April 2020 were:

- 21 percent below the export level of 10 years ago
- 33 percent below the export level of two years ago
- 9 percent below the previous record low of the last decade

Year to date exports from Washington state, the principle apple exporting state, are behind 6.6 million, 40-pound equivalents when comparing against a similar crop volume from 2017-18.

## 4. RECORD-SETTING LEVELS OF EXISTING STOCKS

The U.S. Apple Association publishes a monthly national survey (Appendix 2) of 250 storage locations comprising more than 95 percent of apple storages across the U.S.

As of June 1, 2020, a record-setting 47.9 million bushels of apples remain in storage, a quantity 15 percent higher than the previous record. An incredible 19 percent of the 2019 crop remains to be sold, with 2020 harvest beginning in less than two months. The quantity of stocks is an increase of 24 percent since last year and is 26 percent greater than the five-year average. Even though the 2019 crop was far from the largest on record, coming in as the ninth largest, the June 1 inventory is, by far, the largest on record.

With the 2020 crop harvest set to begin in less than two months, the large inventory is exerting tremendous downward pressure on prices received by growers, and the situation has reached emergency levels.

## Additional facts about existing stocks

1. The June 1 inventory represents a whopping 19 percent of the 2019 crop ( 253 million, 42 -pound units)
2. The 19 percent remaining inventory is also a new record for inventory versus crop
3. The two tables below illustrate the June 1 record-breaking inventory and support that external events (COVID-19) have strongly influenced the movement of apples to the marketplace.

## June Apple Inventories

Since 1994, the June 2020 fresh apple holdings are 15\% higher than the previous record

## 5. Value of the 2019 U.S. Apple Crop

The value of U.S. apple production in 2019 was the lowest since 2010, having declined $\$ 681$ million in two years, and \$211 million since last year.

The combination of the slow pace of domestic sales, the lowest export levels in 10 years for the current month, and record-setting inventories have exerted downward pressure on prices received by growers, sufficient to reduce the value of the 2019 crop to lowest level in 10 years.

## Apple, Commerical Value of Utilized Production

United States: 2010-2019

20

## 6. COVID-19 Costs Yet to be Determined

Although we can predict with certainty that record inventories will continue to depress already low prices, we can only speculate about the ultimate impact on net returns contributed by the additional costs of adopting COVID-19 best practices. Like other segments of agriculture, apple growers are price takers, not price makers. Thus, COVID-19 costs incurred by downstream market participants get passed back to the grower in the form of lower prices.

During the study period, apple packer/shippers began implementing social distancing and other measures to address COVID-19, reducing productivity by as much as 50 percent. Industry estimates on the additional costs of those practices have already exceeded $\$ 1$ per bushel. At current prices, that alone impacts growers by more than 5 percent.

Going forward, social distancing of harvest workers, housing and transportation and other COVID-19 best practices will reduce efficiencies and increase the growers' largest cost by approximately 50 percent.

## B. Payments for crop shipments that left the farm by April 15, 2020, and spoiled due to no market.

USDA has set aside $\$ 144,549,000$ under this CARES ACT category of assistance for U.S. apple growers. As currently structured, state Farm Service Agency offices have informed us that apple growers will not qualify to receive assistance under Category 2.
C. Payments for crop shipments that did not leave the farm by April 15, 2020, (for example, were harvested but sitting in crates on the farm), or mature crops that were unharvested by that date (for example, were plowed under) due to lack of buyers, and which have not been and will not be sold.

USDA has set aside $\$ 29,165,000$ under this CCC category of assistance for U.S. apple growers. Not surprisingly, as currently structured, state Farm Service Agency offices have informed us that apple growers will not qualify to receive assistance under Category 3.

## CLOSING

We wish to note that we are also in full agreement with the comments that have been submitted by Chelan Fresh Marketing and its affiliated packing houses handling the fruit of more than 400 growers, the comments of the Northwest Horticultural Council, and the comments of Blue Star Growers.

Thank you for the opportunity to prove the case that apple growers are deserving of the direct financial support intended by Congress, and the data we presented here meet USDA's criteria for doing so. If we can answer questions, please allow us the opportunity to do so.

Sincerely,<br>U.S. Apple Association<br>California Apple Commission<br>Michigan Apple Committee<br>Midwest Apple Improvement Association<br>New England Apple Association<br>New York Apple Association<br>North Carolina Apple Growers Association<br>Northwest Horticultural Council<br>Pennsylvania Apple Program<br>Washington Apple Commission<br>Washington State Tree Fruit Association<br>Wisconsin Apple Growers Association

## Appendix 1

April 24, 2020

The Honorable Sonny Perdue
Secretary of Agriculture
Dear Secretary Perdue,
As organizations representing apple, pear and sweet cherry growers we wrote you on April 10, 2020 and provided detailed information about the unique production cycle and standard business practices of the tree fruit industry. We request that this information and our unique circumstances be taken into account when developing a program to provide direct payments to specialty crop growers under the CARES Act.

We are seeking to quantify at an industry level the losses for the 2020 marketing year. Current estimates suggest $\$ 180$ million for apples, $\$ 50$ million for pears and $\$ 100$ million for cherries. Projecting future losses is challenging and our estimates are an attempt to assist you and your team in what is recognized as a difficult process.

Our growers are experiencing the same substantial downturns as the rest of agriculture. However, there are additional significant and unique complexities in quantifying losses due to crop storage periods, pooling arrangements and accounting, pack-outs, and grower return calculations. Because of these complexities and the short time frame being faced, we have developed the following framework that is designed to be reasonable, understandable, and less complex by using aggregate industry pricing data for apples and pears.

These recommendations are based on dividing the direct payment program into two claim periods January 1 to April 15, 2020, and April 16, 2020 through the next two quarters, consistent with the details contained in news media accounts that we have seen. This framework, can be used by growers of all sizes to calculate price losses, ensuring a consistent approach without adding unnecessary complexity.

Tree fruit is stored in bins in controlled atmosphere and then packed into cartons for shipment as retail orders are placed. To simplify the process and get the best results, we suggest that growers:

## First Part Claim

1. Determine and list the number of unpacked bins on January 1, 2020 and April 16, 2020.
2. Obtain the average price loss information from state grower associations or best comparable source for the period of January 1 to April 15, 2020.
3. For losses of $5 \%$ or greater, multiply the price loss amount per bin times the number of unpacked bins.
4. Multiply this figure by $85 \%$ for the first payment.

## Second Part Claim

1. For "expected" additional Price Losses ( $5 \%$ and greater in total) from April 15, 2020 through the next two quarters, multiply that expected Price Loss per bin times the number of unpacked bins on April 16, 2020.
2. Multiply the outcome of the above times $30 \%$ for the second payment.

In addition to these documented price losses, our industry is also experiencing decreased productivity and new costs as we incorporate the recommendations of best practices such as social distancing of our employees in the field, packing facility and worker housing. Protective measures in packinghouses have - in addition to direct materials costs for sanitizer, etc. - decreased productivity and capacity by an estimated 15 to 20 percent, increasing the per-box costs but not the sales price.

Apple packers have identified a $\$ 1.00$ per box increased labor cost. This estimate is likely conservative as it does not include costs incurred to increase social distancing in worker housing, suspended operations for deep cleaning activities in housing and packinghouses, or a plant that has increased workforce absenteeism. Workforce demands in the orchard are just beginning but will also likely entail similar protective cost increases in the orchard due to longer and less productive days to accommodate social distancing. In California, the cherry industry estimates it will spend an additional $\$ 10$ million dollars on masks alone, equating to $\$ 1.50$ to $\$ 2.00$ per box of fruit.

Tree fruit growers are very large users of the H2A guestworker program. It is easily conceivable that a May through August slowdown or shut down at the border would result in millions of dollars in tree fruit left unharvested. Of course, right now, we have no way of calculating that impact.

We strongly encourage you to include these increased costs and potential crop losses due to labor shortages as qualifying loses. Because many of these losses will not be known until the summer and fall we also urge you to extend the direct payment program through a minimum of six months as is the case with the food purchases.

We thank you and your team for your hard work during difficult times. If we can provide additional information, please allow us the opportunity to do so.

Sincerely,<br>California Apple Commission<br>California Cherry Board<br>California Pear Advisory Board<br>Michigan Apple Committee<br>New York Apple Association<br>Northwest Horticultural Council<br>U.S. Apple Association<br>Washington Apple Commission<br>Washington State Fruit Commission<br>Washington State Tree Fruit Association

## Key Numbers

### 34.1 Million Fresh-Market Holdings

U.S. fresh-market apple holdings of 34.1 million bushels on June 1, 2020, are 23 percent greater than the June 1,2019 holdings of 27.7 million bushels, and 26 percent greater than the fiveyear average of 27.0 million bushels.

Total U.S. Fresh and Processing Holdings on May 1

### 13.8 Million Processing Apple Holdings

Total processing apple holdings as of June 1, 2020, were 13.8 million bushels, 28 percent greater than those on June 1, 2019, and 25 percent greater than the five-year average for that date.
